Subject: AA Mineral Specimens update 3rd June 2007

Hi everyone,

Welcome to our latest update. We are currently receiving specimens after a buying trip. Among these specimens are some particularly interesting items, including.

[Native Copper](#) from Mt Isa, Queensland, Australia. This specimen shows a combination of dendritic and crystalline forms with dodecahedrons, cubes and octahedrons many of which are twinned.

[Actinolite](#) again from the Mt Isa area. Huge green black crystals forming a sub-parallel splay in a very light cream contrasting calcareous matrix.

Quartz crystal clusters (stock items **[720100](#)** and **[720101](#)**) from China. These may sound pretty ordinary but these are doubly terminated with an exotic intersecting geometry and remarkable clarity.

[Aquamarine](#), very light watery blue. Excellent crystal form with an unusual termination form. From China.

Further samples will be unpacked and listed over the next few days so keep checking the website for continuing updates.

We will be attending the Gosford, NSW, Australia Mineral Fair over the Queens Birthday long weekend on 8th to 11th June and look forward to meeting our friends, customers and fellow enthusiasts. Over that weekend, we may not be able to attend to our email or to phone enquiries as diligently as we usually do.

Best wishes

Susan Lafferty & Bruce Myles
