Dear David A.,

Our **Featured Mineral of the Month** for September is **Sand-rose** a sub-variety of the selenite variety of the common mineral, gypsum. The best Gypsum sand rose specimens are only found in desert regions. Ours are from the greatest desert of all, the Sahara desert.

We have some exceptional specimens from the Erg Chebbi locality that could be a wonderful addition to your collection. This purchase was made from a new resource in Morocco and in addition to the exceptional quality of the specimens we have some exceptionally large specimens for cabinet and mantle type display purposes.

The **Offerings** for September include four minerals and

one rock. The minerals are from the United States, China, Morocco, and Brazil. The rock is Bumble Bee Jasper which is gemstone material from Indonesia. Christine found the Bumble Bee Jasper at the Springfield Massachusetts Show just after reading an article about it in the August issue of Rock and Gem magazine. So while it may deviate from the "norm" of what we offer to collectors, we hope that you will find it as interesting and visually appealing as we did. And it has only recently become available to the western markets.

There is also a Calcite Assemblage that was inspired by another article entitled "Crazy Calcite", written by Bob Jones in the July issue of Rock and Gem Magazine. That article is available for you to read under the Library tab on our website.

As always, we try to include in our monthly offering specimens with interesting contrasts in colors, structures, textures, and origins. The colors of our offers range from amber, orange-brown, and aquamarine-blue to a kaleidoscopic yellow-orange-black. The origins of these specimens include hydrothermal veins, granite pegmatites, and even volcanic fumarole environments.
